

EVALUATING THE GRAZING SYSTEM

Good Pasture Management Provides:

1. Sufficient forage species that livestock will readily consume
2. Enough legumes for nitrogen and quality forage
3. A live, green, efficient solar panel
4. Plant residue to protect soil and conserve moisture
5. Plant diversity to supply adequate forage throughout the season
6. Adequate stop grazing heights and good intake from a full bite
7. Limited Concentrated Areas and or Trailing
8. Healthy soils increasing in organic matter
9. Adequate recovery before being grazed again
10. Minimal or no erosion
